

Hellomatik

The written map of how a company decides, and the agents that work on it. In production on European infrastructure, and designed so that a person approves every action.

Agents without a map act on tables. Agents without a border cannot be bought in Europe.

What companies have

Data in an ERP, a CRM, a warehouse system and spreadsheets. Rules that live in people's heads. Actions that nobody has written down.

What agent products offer

A model on top of the raw tables, hosted outside the EU, that executes without anyone signing. The buyer who signs the data processing agreement says no.

Map, agents, approval

Ontology layer

Connects the company's sources, prepares and calculates the data, and publishes named capabilities through the company's own API.

Agent layer

Runs agents and decision procedures over those capabilities. The formula written once is used by every agent of that company.

Approval

Each action in the map carries the role that must approve it. The company chooses what runs alone and what waits for a named person. Execution behind approval is the layer in development.

A purchase order, prepared by the agent, approved by a person

Step	Who	What
Stock below the rule for 14 items	Ontology	Capability "items below reorder point" returns the list with supplier and lead time
Draft purchase order	Agent	Quantities from the formula, supplier from the history, cost from the price list
Approve, change or reject	Purchasing	One screen, one signature; the reason is written into the history
Send to supplier	System	Only after approval

Four customers, four industries, first year, no outside capital

- Sportswear manufacturer
- Multinational building-products group
- Private healthcare clinic
- Specialist retailer

From the deposited method report (DOI [10.5281/zenodo.22647735](https://doi.org/10.5281/zenodo.22647735))

29,000 customers recalculated nightly over 14 million sales lines. 24 rules over live warehouse and ERP data, 30 million operations, 460,000 locations.

Agent traffic inverts the inference benchmarks

202 : 1

input tokens per output token, median of 362
production calls

87 %

of the median prompt already served from cache

Why it matters

Serving engines and parallelism strategies are tuned for short prompts and long generations. Nobody has published how the opposite profile behaves at scale. Five EuroHPC proposals submitted on this measurement; every result table will be public.

The buyer is the person who signs the data processing agreement

European mid-sized companies in manufacturing, distribution, healthcare and retail. The same two people decide in every one of them: the one who signs the DPA and the one who approves purchase orders. Both conditions are built into the product: EU data residency by contract, approval by design.

Entry through one department and one use case; expansion through the map, because the second use case reuses what the first one wrote down.

Why not the others

What we do that the alternatives do not

	Hellomatik	US agent platforms	In-house projects
Data stays in the EU by contract	Yes	Rarely	Yes
Human approval before any external action	By design	Optional	Custom
Ontology reused by every agent	Yes	Per prompt	Per project
Open-weight models, measured	Yes, published	Closed	Unmeasured

Next 24 months

- Sovereign inference on open-weight models, characterised and published (EuroHPC campaign, NVIDIA GPUs, vLLM)
- Ontology tooling so that a new customer costs a map, not a project
- Two more industries through direct sales; Portugal and Italy first
- Team: engineers for ontology writing and inference serving

Two co-founders, joint administrators

Isaac Correa Villa

Author of the method report and of the platform. Before Hellomatik, about 300 dashboards delivered to clients in the United States, Europe, South America and South Korea, 103 verified reviews; co-founded Kodalogic.

Daniel Correa Villa

Co-founder and joint administrator.

Ask: partners and investors to take the written operating model to European mid-sized companies in two more industries. isaac.correa@hellomatik.com
